Ethidium Bromide Solutions Detoxification

SafetyNet #: 53

Ethidium bromide (EtBr) is commonly used as a non-radioactive DNA stain to identify and visualize nucleic acid bands in electrophoresis and perform other methods of nucleic acid separation. EtBr is a dark red, crystalline, non-volatile powder that is moderately soluble in water. Solutions of EtBr fluoresce readily with a reddish-brown color when exposed to ultraviolet (UV) light. Ethidium bromide is a powerful mutagen commonly used in molecular biology research and generated in dilute aqueous solutions. In the Ames test, 90 µg of ethidium bromide is as mutagenic as the smoke from one cigarette. Due to ethidium bromide's mutagenic activity, EH&S recommends that a detoxification procedure for ethidium bromide be incorporated into experimental protocols. Spent or used ethidium bromide may be collected and detoxified in a batch, so long as the container is labeled “spent” or “used” ethidium bromide. One formerly recommended technique was oxidation of ethidium bromide by household bleach. Further research has shown that this treatment produces compounds that are more hazardous than the parent (Lunn and Sansone, 1987). Oxidation with bleach is not an acceptable destruction technique and must not be used.

There are numerous products and methods now available for the detoxification of ethidium bromide solutions. Methods include simple procedures such as destaining bags that are placed directly in the solution and dye removal cartridges that remove the dyes from the solutions. The following companies offer detoxification products:

Because ethidium bromide is a powerful mutagen, the campus does not allow sewer disposal of any waste containing ethidium bromide at concentrations greater than 0.01mg/l. Solutions of ethidium bromide exceeding this concentration should either be treated using one of the above methods, or picked up by EH&S for disposal. Dried ethidium bromide gels and products used in decontamination must be disposed through EH&S. See SafetyNet #8 [1], “Guidelines for Disposal of Chemical Waste” for more information.

Several substitutes for ethidium bromide have been developed: SYBR Safe (manufactured by Invitrogen), GelRed (in water only) and GelGreen (manufactured by Phoenix Research). These
are proprietary compounds that some researchers have found work as well as ethidium bromide without the hazards and management requirements for ethidium bromide. These three substitutes do not have to be disposed as hazardous waste. They have also been shown to be much less mutagenic than ethidium bromide.
